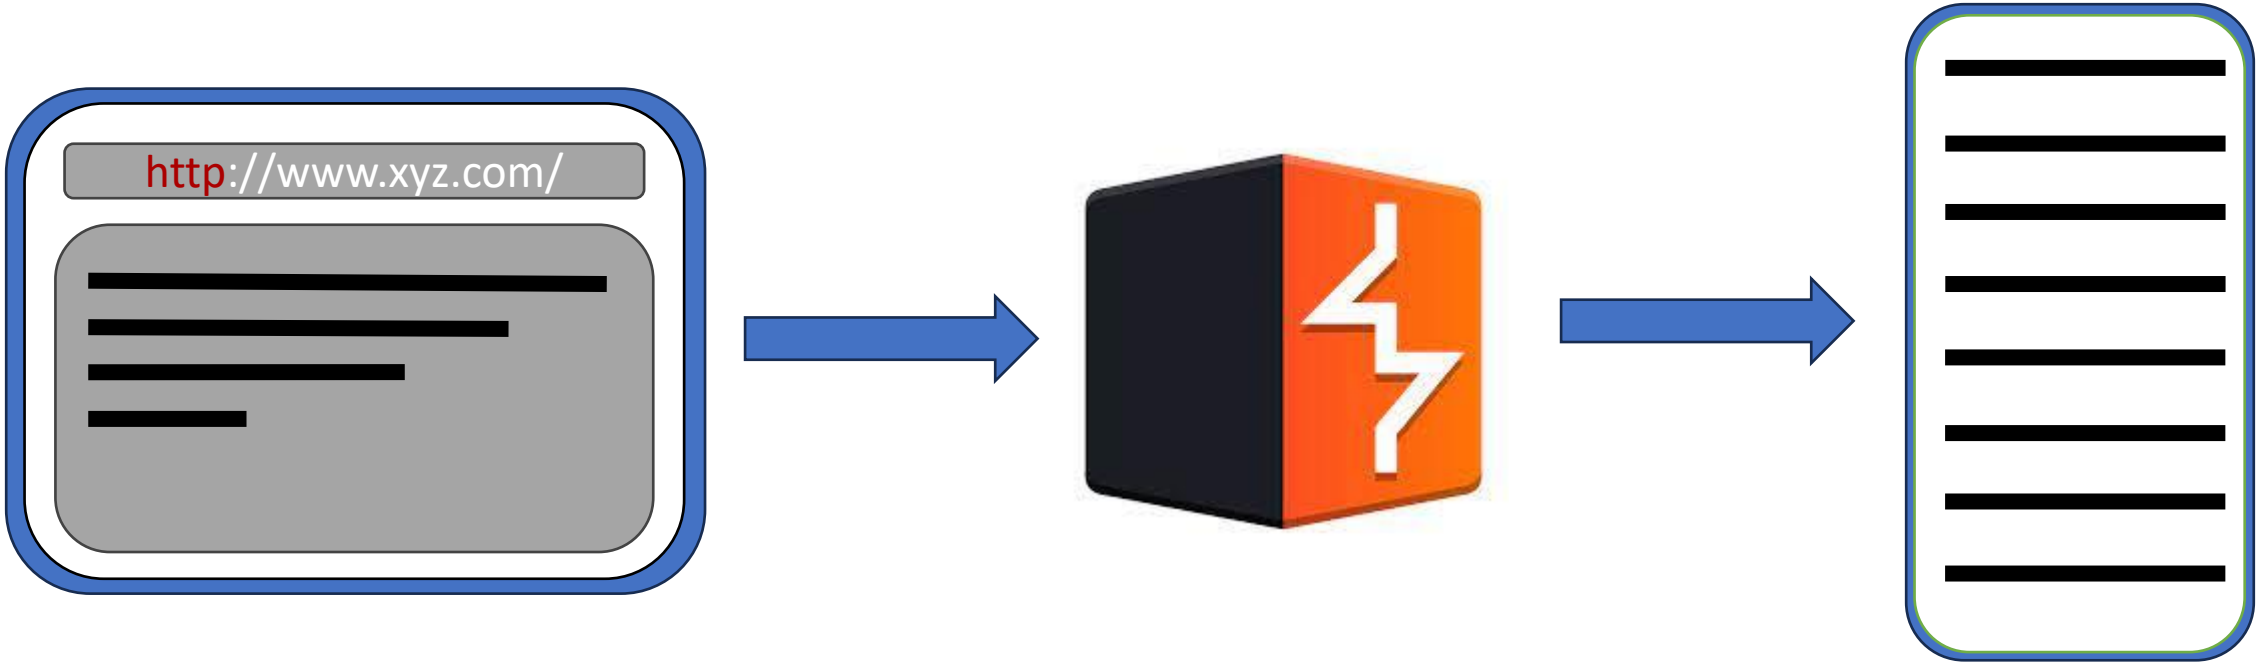
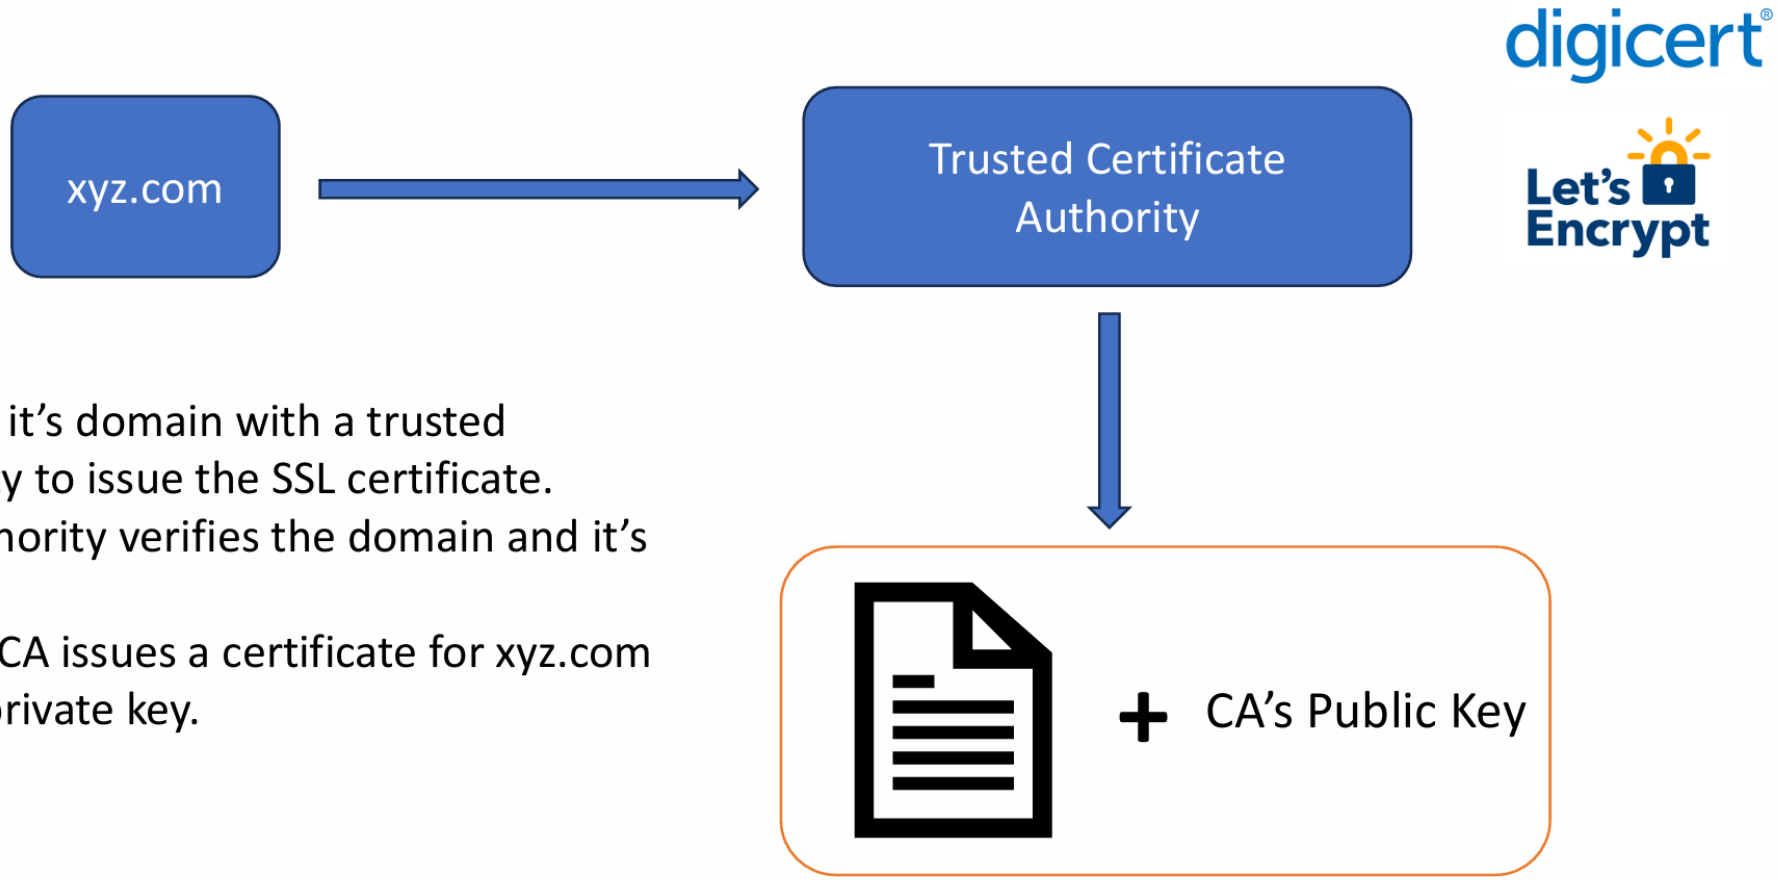
Intercepting HTTP Traffic Using Burp



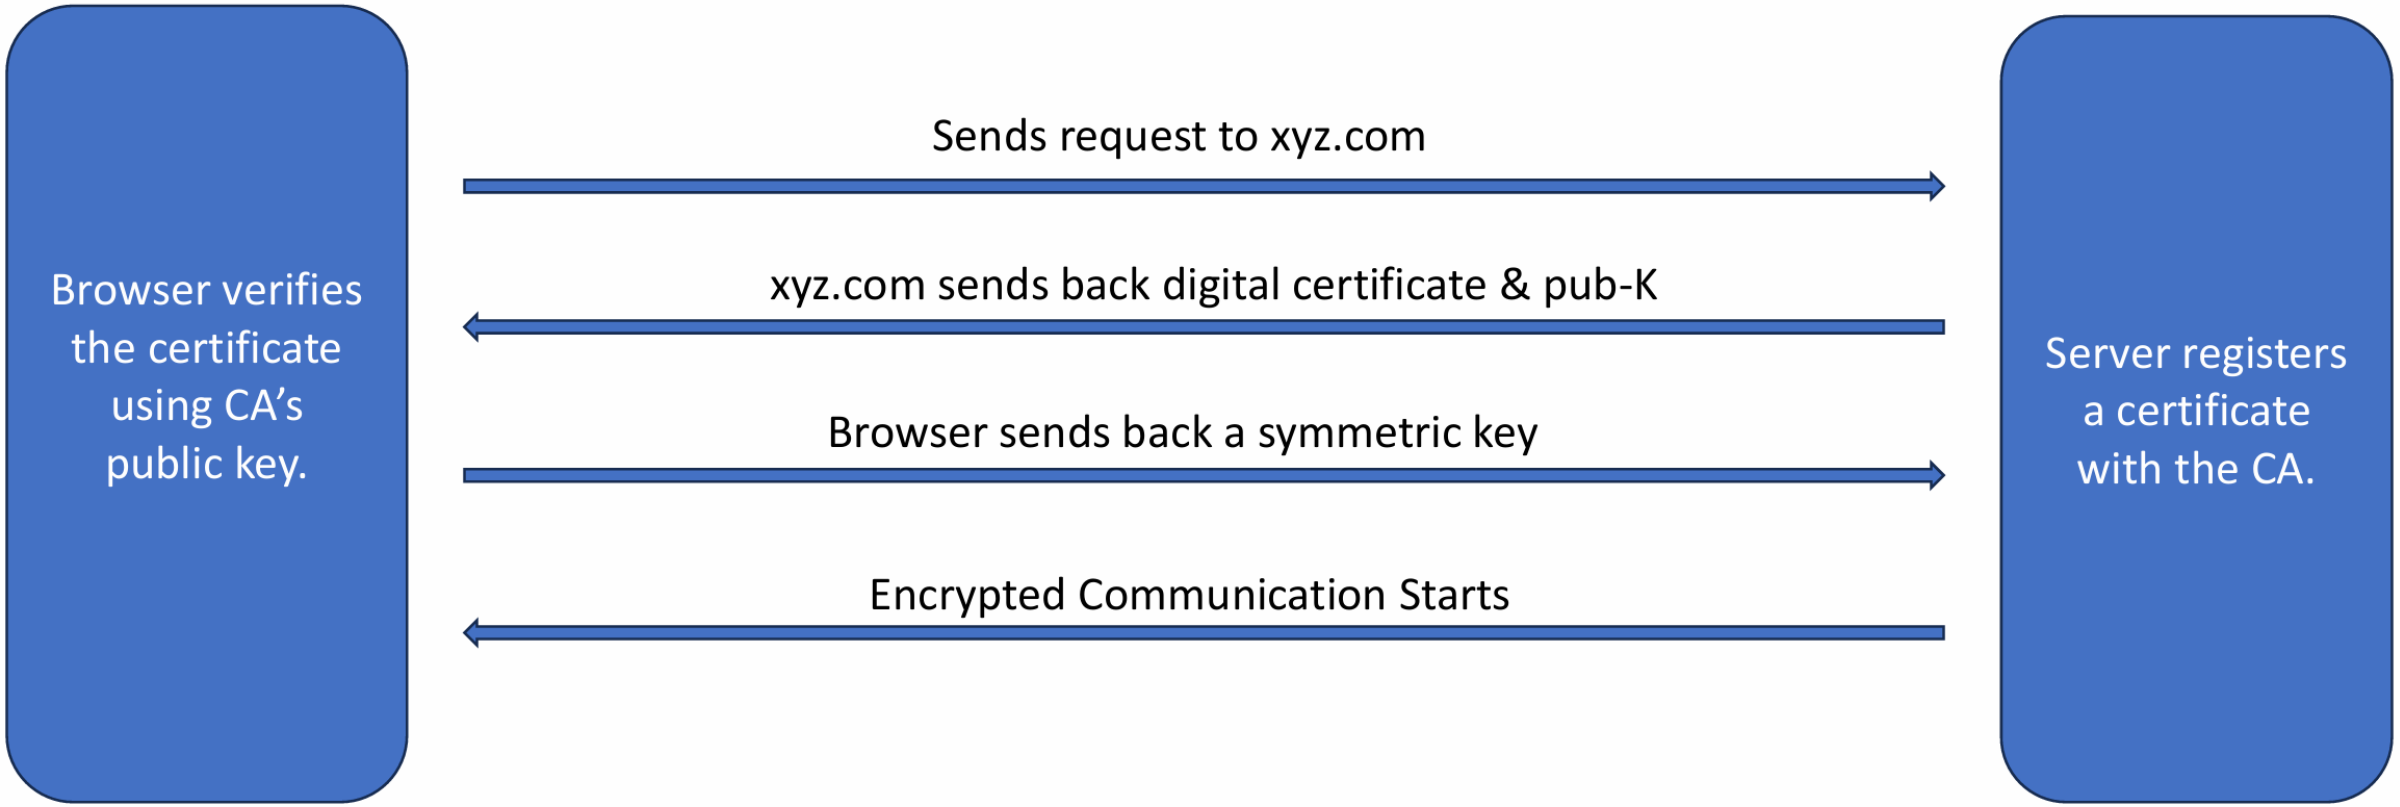
xyz.com

XYZ Issues a SSL Cert.



1. Company registers it's domain with a trusted certificate authority to issue the SSL certificate.
2. The certificate authority verifies the domain and it's ownership.
3. Once verified, the CA issues a certificate for xyz.com signed using CA's private key.

HTTP Protocol using SSL



1. Browser sends request to xyz.com
2. Xyz.com responds back with it's certificate and public key
3. Browser verifies the certificate using the public key of CA who issued the certificate.
4. Once verified, browser sends symmetric key and the encrypted communication starts.

Browser’s Trust Store

Browser’s come with a set of pre-installed certificates, these are simply certificates of globally trusted certificate authorities. Browser’s use these in order to verify SSL certificate received by websites.
